Re: Cloud Platform Manager — Migration (Requisition 47660)

Dear Hiring Manager,

I'm applying for the Cloud Platform Manager — Migration role in Bunge's Business Technology organization. I've spent the last 14 years running cloud infrastructure and leading operations teams — most recently as Manager, Cloud Operations at Energy Exemplar, and before that as Associate Manager, Cloud Operations at Western Union. The mandate behind this role — build a cloud platform that application teams consume through self-service and standard patterns, not a ticket queue — is close to what I've actually been doing, even though my last two titles said operations rather than platform engineering.

At Energy Exemplar, the environment I ran spanned 25–30 AWS accounts with roughly 3,000 EC2 instances, plus 13 Azure subscriptions running 18 AKS clusters, all managed through ArgoCD and GitOps — every change to what's running in a cluster traces back to a commit, so a rollback is a revert, not a scramble to reconstruct what changed. That's the same principle platform-as-a-product runs on: Terraform for infrastructure as code, standardized patterns instead of one-off builds per team, and enough automation that application teams aren't waiting on a ticket for a standard service. I also built a centralized LLM gateway (LiteLLM Enterprise) for the same reason — nine-plus production applications were heading toward every team holding its own provider keys with no central visibility into spend or access, so I gave them one governed path in instead of nine separate ones.

I led a 25-person hybrid team — 10 in-house engineers and 15 through a vendor partner — and ran it the way a platform organization needs to run: biweekly 1:1s instead of an annual review carrying all the weight, weekly syncs with product teams to keep infrastructure ahead of new application onboarding instead of finding out about it the week it's due, and a monthly report to my VP translating the month's operational work into the value it actually created. At Western Union, I represented cloud infrastructure in Architecture Review Board sessions and ran the AWS TAM relationship directly — the same kind of internal and external stakeholder work this role lists under Key Relations.

On reliability and governance: I've supported SOC 1, SOC 2, and ISO 27001 audits, run vulnerability remediation on SLA-based timelines rather than a flat monthly patch cycle, and held 99.99% uptime through proactive monitoring, tuned alert thresholds, and a real escalation matrix rather than alerts that fire into nowhere. FinOps was a continuous discipline rather than a quarterly review — spend anomalies got caught within the month they happened, not three months later.

One thing worth saying directly: my hands-on depth is in AWS and Azure, not GCP, which I know this role lists as preferred. The engineering discipline underneath — IaC, GitOps, Kubernetes, platform-as-a-product, SRE — is the same regardless of provider, and I'd rather say that plainly than imply GCP experience I don't have. I'm available to start immediately and would welcome the chance to talk through how this background maps to what Bunge's Cloud Center of Excellence needs next.

Sincerely,
Vishal Bhilare
