Terraform Workflow

Screenshot gallery — 7 captures, in session order

Terraform Workflow

Terraform Workflow refers to the general process and set of best practices for managing infrastructure using **Terraform**, an Infrastructure as Code (IaC) tool developed by HashiCorp. The workflow helps you define, provision, and manage cloud infrastructure in a predictable and repeatable way.

Here's a breakdown of the core steps:

Basic Terraform Workflow (in 5 Steps):

Write – ***Define your infrastructure***

You create .tf files (Terraform files) with code that describes what infrastructure you want.

Example: "I want ec2 servers in AWS."

Initialize – ***Prepare Terraform***

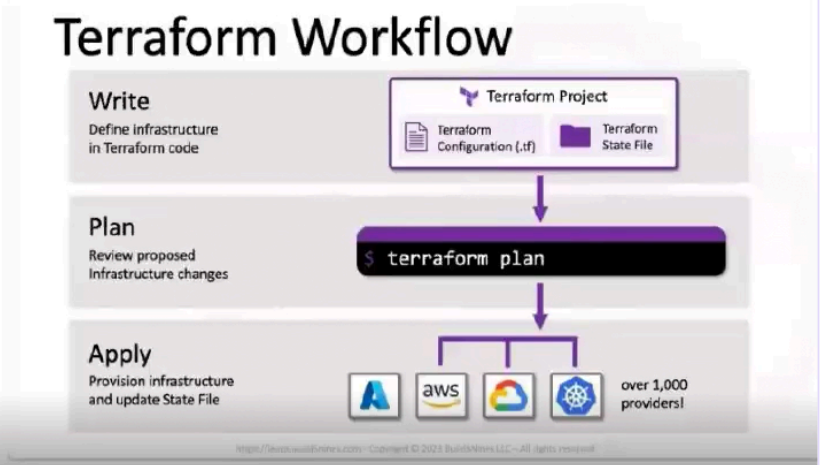

terraform init

This sets up Terraform in your project and downloads any necessary plugins (called providers, like AWS, Azure, etc.)

Plan – ***Preview what will happen***

terraform plan

Terraform shows what it *plans* to do — **like what will be created, changed, or destroyed**.

Terraform Workflow refers to the general process and set of best practices for managing infrastructure using **Terraform**, an Infrastructure as Code (IaC) tool developed by HashiCorp. The workflow helps you define, provision, and manage cloud infrastructure in a predictable and repeatable way.

Here's a breakdown of the core steps:

Basic Terraform Workflow (in 5 Steps):

Write – ***Define your infrastructure***

You create .tf files (Terraform files) with code that describes what infrastructure you want.

Example: "I want ec2 servers in AWS."

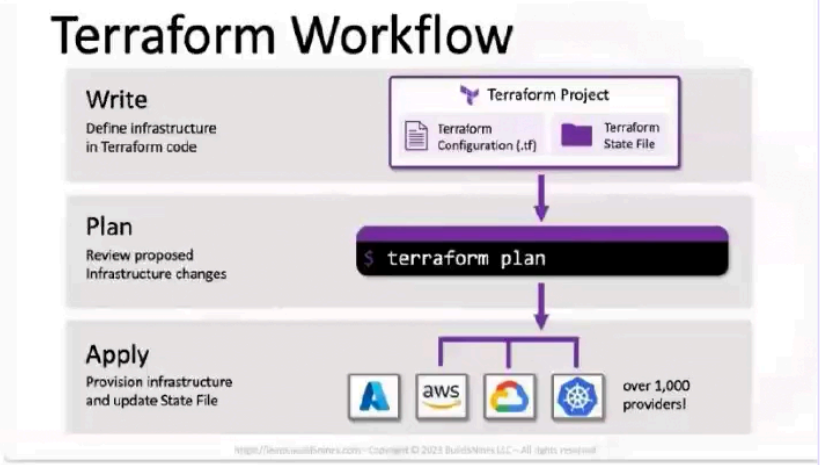

Initialize – ***Prepare Terraform***

```
# terraform init
```

This sets up Terraform in your project and downloads any necessary plugins (called providers, like AWS, Azure, etc.)

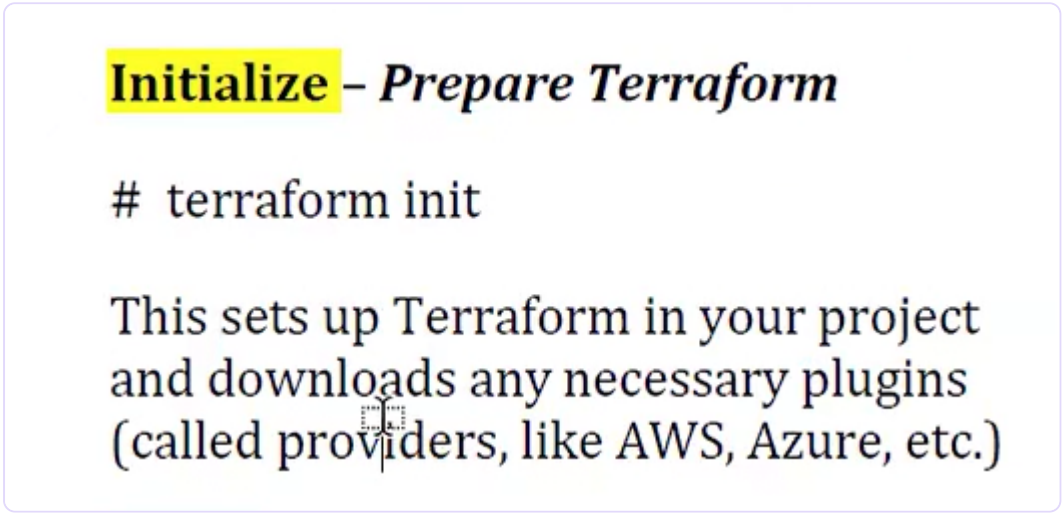

Plan – ***Preview what will happen***

```
# terraform plan
```

Terraform shows what it *plans* to do — **like what will be created, changed, or destroyed**.

This helps you catch mistakes **before** anything changes kind of DRY run.

Initialize – Prepare Terraform
terraform init
This sets up Terraform in your project
and downloads any necessary plugins
(called providers, like AWS, Azure, etc.)

Plan – *Preview what will happen*

```
# terraform plan
```

Terraform shows what it *plans* to do — **like what will be created, changed, or destroyed**.

This helps you catch mistakes **before** anything changes kind of DRY run.

Apply – *Make it real*

terraform apply

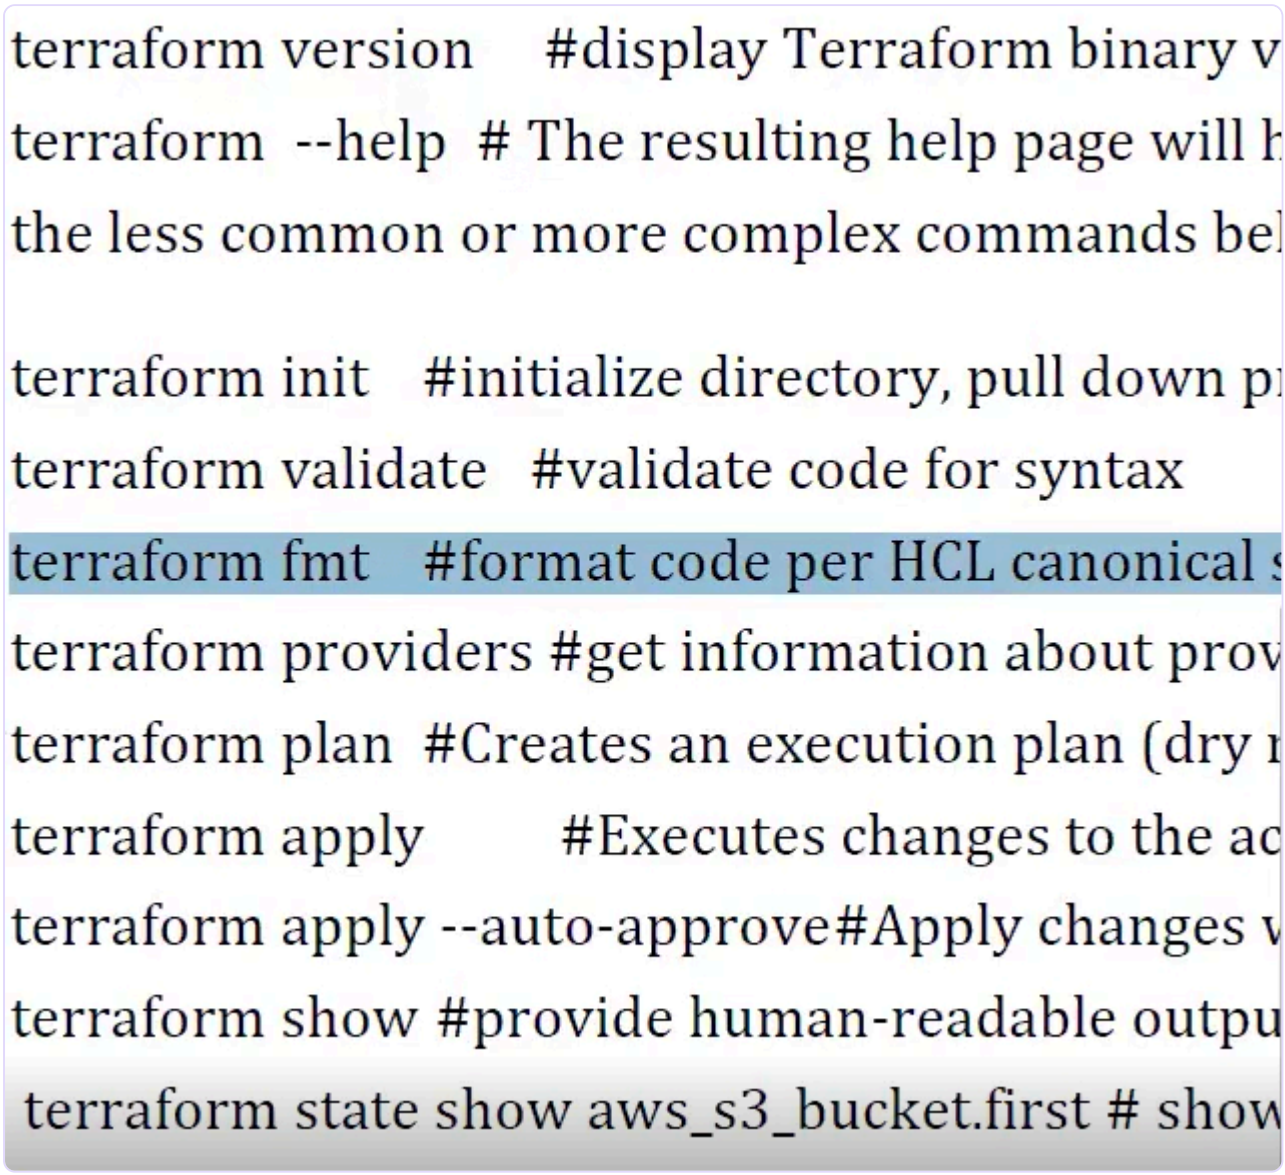

Terraform **actually creates or updates** your infrastructure to match the code.

Destroy – ***Release Resources***

terraform destroy

If you want to delete everything, use terraform destroy.

This removes all the resources Terraform created.
